

IN THE CLAIMS:

The text of all pending claims are set forth below. Cancelled claims are indicated with claim number and status only. The claims as listed below show added text with underlining and deleted text with ~~strike through~~. The status of each claim is indicated with one of (original), (currently amended), (previously presented), (cancelled), (withdrawn), or (new).

Please AMEND the claims in accordance with the following:

1. (CURRENTLY AMENDED) ~~An~~ A computer application managing method for a case where a plurality of computer applications are stored in a computer-readable storage at locations of the storage, the method comprising:

electronically storing, in the computer-readable storage, a directory structure corresponding to the plurality of applications;

in the computer-readable storage, giving information of the application addresses directly to ~~predetermined~~ directories of the directory structure, respectively, the application address information being for identifying the applications, respectively, where the applications are needed for corresponding data files stored in the computer-readable storage using the ~~predetermined~~ directories, respectively; and

electronically performing management so that when one of the data files is selected a needed application corresponding to the data file of a directory of the ~~predetermined~~ directories is automatically selected and executed by referring to the selected data file's directory to obtain its application's address information and therewith access and execute the application at the computer-readable storage location of the thus-obtained address information given to the directory, where the selection for execution is responsive to the data file of the directory being selected,

wherein one of the plurality of applications is needed when one of the data files is selected.

2. (CANCELED)

3. (CURRENTLY AMENDED) The computer application managing method, according to claim 1, further comprising:
preparing an application management table storing the information of the application addresses; and
referring to the application management table when a directory of the ~~predetermined~~ directories is selected, so as to recognize a starting address of an application of the plurality of applications, the starting address corresponding to an item of the application address information given to the directory of the ~~predetermined~~ directories, and to access the application of the plurality of applications.

4. (CURRENTLY AMENDED) The computer application managing method, according to claim 1, further comprising:
storing size information at a starting address of each application of the plurality of applications, the size information indicating a size of the application of the plurality of applications; and
repeating detection of the size of an application of the plurality of applications from the size information stored in the starting address of the application of the plurality of applications, and search for a starting address of a next application of the plurality of applications in accordance with the size of the preceding application of the plurality of applications, so as to obtain the starting address of a desired application of the plurality of applications.

5. (CURRENTLY AMENDED) The computer application managing method, according to claim 1, wherein an item of the information of the application addresses is given to the highest directory of the directory structure.

6. (PREVIOUSLY PRESENTED) The application managing method, according to claim 1, wherein an item of the information of application addresses is given to each directory of the directory structure.

7. (CURRENTLY AMENDED) The computer application managing method, according to claim 1, wherein, when an application of the plurality of applications is substantially

deleted, an item of the information of the application addresses for the application of the plurality of applications is caused to be ineffective.

8. (CURRENTLY AMENDED) The computer application managing method, according to claim 1,

wherein when an application of the plurality of applications is updated, an application obtained from updating the application of the plurality of applications is added to the plurality of applications, and

wherein an item of the information of the application addresses for identifying the application of the plurality of applications is changed to an item of identification information for identifying the application obtained from updating the application of the plurality of applications.

9-11. (CANCELED)

12. (CURRENTLY AMENDED) An information processing apparatus, storing a plurality of applications at ~~locations~~ addresses of a computer-readable storage, comprising:

a directory structure in the computer-readable storage corresponding to the plurality of applications,

wherein in the computer-readable storage information of the application addresses are given directly to ~~predetermined~~ directories of the directory structure, respectively, the application address information being for identifying the applications, respectively, where the ~~ef~~ applications are needed for corresponding data files, and where the data files are organized and stored in the computer-readable storage using the ~~predetermined~~ directories of the directory structure,

wherein one of the plurality of applications is needed when one of the data files is selected.

13. (CANCELED)

14. (PREVIOUSLY PRESENTED) The information processing apparatus according to claim 12, further comprising:

an application management table that stores the information of the application

addresses.

15. (PREVIOUSLY PRESENTED) The information processing apparatus, according to claim 12, wherein an item of the information of the application addresses is given to the highest directory of the directory structure.

16. (PREVIOUSLY PRESENTED) The information processing apparatus, according to claim 12, wherein an item of the information of the application addresses is given to each directory of the directory structure.

17. (CANCELED)

18. (WITHDRAWN) A method, comprising:
storing a file structure on an IC (integrated circuit) card, wherein each of a plurality of data files in the file structure corresponds respectively to one of a plurality of applications that are stored on the IC card;
receiving a selection of one of the plurality of data files; and
executing one of the plurality of applications, which corresponds to the one of the plurality of data files, based on one of a corresponding plurality of starting addresses that are stored directly with directory structures in the file structure by accessing a directory structure to obtain a starting address in response to the receiving the selection of the one of the plurality of files.

19. (WITHDRAWN) A volatile or non-volatile computer-readable storage storing a file system, the file system comprising:
two or more executable application files each stored at a different respective address in the storage;
two or more hierarchical directory structures comprising hierarchically linked directory structure nodes;
each hierarchical directory structure having directly-stored with one or more directory structure nodes thereof information of the address of an application with which the directory

structure is associated; and

each hierarchical directory structure storing one or more data files associated with the application whose address information is directly-stored with the hierarchical file directory structure, where the hierarchical directory structures and the data files are separate and the data files are linked to the hierarchical directory structures, and where an application is associated with a directory because it is needed when a data file of the directory is selected.

20. (WITHDRAWN) A storage and file system according to claim 19, wherein the application files are not stored in the hierarchical file directories.

21. (WITHDRAWN) A method of using a storage and file system according claim 19, comprising:

accessing one of the data files and in response automatically checking directory structure nodes of the data file's hierarchical file directory to find the directory's directly-stored address and in further response using the so found address to execute an application at the found address.

22. (WITHDRAWN) A method of using a storage and file system according claim 20, comprising:

accessing one of the data files and in response automatically checking directory structure nodes of the data file's hierarchical file directory to find the directory's directly-stored address and in further response using the so found address to execute an application at the found address.

23. (NEW) A method according to claim 1, wherein the directories are predetermined.

24. (NEW) A method according to claim 1, wherein the computer-readable storage comprises a memory card.

25. (NEW) A method according to claim 24, wherein the memory card comprises an IC card.

26. (NEW) A method according to claim 12, wherein the directories are predetermined.
27. (NEW) A method according to claim 12, wherein the computer-readable storage comprises a memory card.
28. (NEW) A method according to claim 27, wherein the memory card comprises an IC card.
